

# Visualising Covid-19 Trends through R Shiny

## **Covid-19**

If I had a nickel for every time I've had to say "these are unprecedented circumstances" in the past few weeks, I would have quite a few. Shelter at home has people going crazy, myself included.

Anyway, I decided to create a shiny dashboard app to visualise corona spreading trends. These visualisations can be super useful in understanding how to model pandemics. I've left the code here. I used the shiny website to deploy the app.

## **Data Source**

While a lot of news outlets and government sources have their own configuration of corona data, I decided to use the open-source data provided by <https://ourworldindata.org/coronavirus>. The interactive graphs they have are way more cooler than mine. But hey, you gotta start somewhere.
